Comparative embryology, on the other hand, is the comparison of embryos across different species. Comparative embryology helps scientists understand more about how species develop the way they do, why certain species have specific characteristics, how animals change from the time they're an embryo to the time they're born, and ultimately, how embryology and evolution are linked.

Comparative embryology is the study of how different types of organisms compare to each other during their fetal stages. Scientists have used comparative embryology to study and gather evidence of evolution. Karl Ernst von Baer, a Russian scientist, made observations on embryos of different species and came up with four principles of comparative embryology:

Comparative Embryology - Evidence for Evolution

The similarities in comparative embryology are also evident in the early stages of development. For example, fish, bird, rabbit, and human embryos are similar in appearance in the early stages. They all have gill slits, a two-chambered heart, and a tail with muscles to move it.

Evidence for Evolution - CliffsNotes

A study of the comparative embryology of a group of animals such as the vertebrates when followed to its logical conclusion leads to a consideration of the comparative anatomy of the group. Students claim, and justly so, that they learn best through the association of events, things, and concepts. As applied to the study of vertebrate ...

The domestic dog (*Canis lupus familiaris*) has been derived from an ancestral wolf and now consists of a breed family of more than 300 worldwide, with extensive variations in morphology (size, shape and weight). The modern dog breeds show high phenotypic diversity and are thought to have arisen from this first population bottleneck associated with wolf domestication (7,000–50,000 generations ...

1. Introduction. Classical anatomical embryology of the carotid body (CB) has received considerable attention over the last century and produced many excellent research papers, monographs, and reviews, for example: Adams, 1958 (comparative morphology of the CB); Batten, 1960 (contribution of epidermal placodes to CB development), Murillo-Ferrol, 1967 (morphological development of the avian CB ...

Comparative Embryology of the Carotid Body

Embryology, the study of the formation and development of an embryo and fetus. Before widespread use of the microscope and the advent of cellular biology in the 19th century, embryology was based on descriptive and comparative studies. From the time of the Greek philosopher Aristotle it was debated whether the embryo was a preformed, miniature individual (a homunculus) or an undifferentiated ...

Embryology | Britannica

Haeckel's controversial comparative embryology drawings released in 1874 showed a developing human embryo passing through stages that resembled different animals, such as embryonic fish, chickens and rabbits. The notion of recapitulation drew plenty of critics, notably Karl von Baer, who also took a disliking to Darwin's ideas.

How Does Embryology Provide Evidence for Evolution ...

Through comparative embryology, scientists now believe that the chordates arose from a primitive sessile-benthic arm-feeding echinoderm. Tunicates are small marine invertebrate chordates quite common today; they may hold the key to vertebrate origins. Tunicates have a sessile adult stage in which they are filter-feeders with gill slits but no ...

With the renewed interest in comparative embryology, interspecific comparisons are increasingly based on developmental events instead of staging tables (for discussion see e.g., de Jong et al., 2009; Werneburg, 2009). Such approaches lack the bias towards finding similarity as opposed to the latter in both inter- and intraspecific comparisons.
