System dynamics is a methodology and mathematical modeling technique to frame, understand, and discuss complex issues and problems. Originally developed in the 1950s to help corporate managers improve their understanding of industrial processes, SD is currently being used throughout the public and private sector for policy analysis and design.

System dynamics - Wikipedia

A model is a precise representation of a system's dynamics used to answer questions via analysis and simulation. The model we choose depends on the questions that we wish to answer, and so there may be multiple models for a single physical system, with different levels of fidelity depending on the phenomena of interest.

System Modeling - Dynamical Systems

Linear dynamical systems can be solved in terms of simple functions and the behavior of all orbits classified. In a linear system the phase space is the N-dimensional Euclidean space, so any point in phase space can be represented by a vector with N numbers. The analysis of linear systems is possible because they satisfy a superposition principle: if $u(t)$ and $w(t)$ satisfy the differential ...

Teaching System Dynamics with MATLAB & Simulink - Video

Modeling of electrical systems is best approached by thinking separately about the element laws and the interaction laws. The interaction laws are Kirchoff's voltage law (KVL) and Kirchoff's current law (KCL). The element laws are relationships for individual components such as resistors (ohm's law, $V = iR$), capacitors, inductors, etc.
