Nonlinear Structural Analysis

A nonlinear analysis is an analysis where a nonlinear relation holds between applied forces and displacements. Nonlinear effects can originate from geometrical nonlinearity's (i.e. large deformations), material nonlinearity's (i.e. elasto-plastic material), and contact.

Linear vs. Nonlinear Analysis •Linear –Structure returns to original form –No changes in loading direction or magnitude –Material properties do not change –Small deformation and strain •Nonlinear –Geometry changes resulting in stiffness change –Material deformation that may not return to original form

Description No structural system behaves as a perfectly elastic structure. Even though structural design is mostly based on linear elastic analysis, a rational design philosophy should account for the basic sources of nonlinearity. Concrete cracking or column buckling are two examples we are all familiar with.

Nonlinear Structural Analysis For Seismic Design

Advanced structural analysis may examine dynamic response, stability and non-linear behavior. There are three approaches to the analysis: the mechanics of materials approach (also known as strength of materials), the elasticity theory approach (which is actually a special case of the more general field of continuum mechanics), and the finite element approach.
