The interest on inducible anti-oxidation for human health has an origin in the observation that phenolic antioxidants, such as butylated hydroxyanisole (BHA), protected animals from benzo[a]pyrene (BaP)-induced tumor formation, which correlated with inhibition of the formation of BaP mutagenic metabolites and induction of GSTs and NQO1, drug-metabolizing enzymes that detoxify many carcinogens and toxicants (Talalay et al., 1978; 1988; Watternberg, 1985).
