### Torsion Spring Design Guide

Design Tips. • Torsion springs should be deflected in the direction that closes the coils • Inside diameters reduce to  $D_m$  when deflected. Mandrel size should be larger than  $D_m$ . • Natives into account the material in the legs. If the force is supplied close to the body of the spring  $N$  is a good approximation.

### Torsion Spring Design

The legs of the torsion springs are attached to separate components, with the flexibility of the wound material providing opposite angular torque around the spring's axis. This force can hold parts in place or store and release the mechanical energy on cue. A higher potential energy results in a tighter, leaner spring.

Torsion Springs - Design Theory. Torsion Spring Design Theory. Torsion springs are stressed in bending. Rectangular wire is more efficient in bending than round wire, but due to the premium cost of rectangular wire, round wire is preferred. Torsion springs, whose ends are rotated in angular deflection, offer resistance to externally applied torque.

Spiral torsion springs are produced from flat steel and are characterized by the requirement that their coils typically do not touch during operation. A spiral torsion spring will exert a rotational torque, usually through 360° rotation or less. The torque curve of a spiral torsion spring is linear to the degree of rotation.

### DESIGN GUIDE - Vulcan Spring

□A torsion spring under load will experience a change in coil diameter. □If the spring is over a pin, the inside diameter of the coil must not be allowed to decrease to the pin diameter. □The angular deflection of the body of the coil, extracted from the total deflection in Eq. (10-52), is

We will be using the basic torsion spring shown in the picture below to show the steps clearly. Measure the wire diameter. The best way to measure the wire diameter is to use a micrometer and measure the wire in two different spots and then take the average. For this spring, the wire diameter is .059 inches.

To determine a torsion spring's direction of wind simply hold the spring in your hand with your fingers placed around the outside of the body and your thumb pointing straight up. If the last coil ends in the same direction that your fingers are pointing, that is the hand (direction of wind) of the spring.
